# Simulated Code for Two-Parameter Functions

# This simulation will only work for two-parameter functions (e.g.,
# power). Please see other code for three parameters.

# Do not choose 0 as a parameter estimate. If you choose 0, the
# simulation will not run.

# This code will take several minutes to run.

# Convergence errors may print but the simulation will
# continue to run until 1,000 estimates converge.

# You will need to install the package nlme to run this code (see code
below).

# install.packages("nlme", dependencies = T)

# FOLLOW STEPS 1-4 IN THE CAPITALIZED COMMENTS AND THEN RUN THE
# ENTIRE CODE. LOOK IN COMMENTS FOR EXAMPLES.

library(nlme)

#####
#####
# STEP 1: REPLACE AAA WITH THE NUMBER AND SPACING OF MEASUREMENT #
# OCCASIONS YOU WOULD LIKE TO SIMULATE. #
#####
#####

temporal.design <- c(AAA)

# Example
# temporal.design <- c(0, 12, 24, 36, 48, 60)

#####
#####
# STEP 2: REPLACE BBB, CCC, DDD, AND EEE WITH THE PARAMETER #
```

```

# VALUES YOU WOULD LIKE TO SIMULATE. ALSO REPLACE FFF WITH THE      #
# NUMBER CLUSTERS YOU WOULD LIKE.                                     #
#                                                                       #
# b0 = VALUE OF FIRST COEFFICIENT                                     #
# b1 = VALUE OF SECOND COEFFICIENT                                   #
# ve = LEVEL ONE VARIANCE                                           #
# tau = LEVEL TWO VARIANCE                                          #
# nn = NUMBER OF CLUSTERS                                           #
#                                                                       #
#####
#####

b0 <- BBB
